

ROPED EDGING

INSTALLATION GUIDE

Installation Recommendations

The most effective way to install banner mesh is by commencing the installation at the top of the mesh, working in a straight line horizontally.

UV resistant ties should be used to attach the banner mesh to the fence at approximately 500mm spacings.

Proceed with installation simply by feeding your tie through the weave of the material, as close to the rope core as possible. The rope core will provide an ultra-strong connection to the fence.

Once the top of the mesh is secured to the fence, commence fixing the bottom edge of the signage, working from the centre out. Once the top and the bottom are both attached, secure both sides.

Important

To ensure the mesh does not act as a sail once installed, it is imperative that the banner is pulled taut against the fence during installation. This will also provide the best visual appearance.

To complete the installation, cut the unrequired length of ties once tightened.
